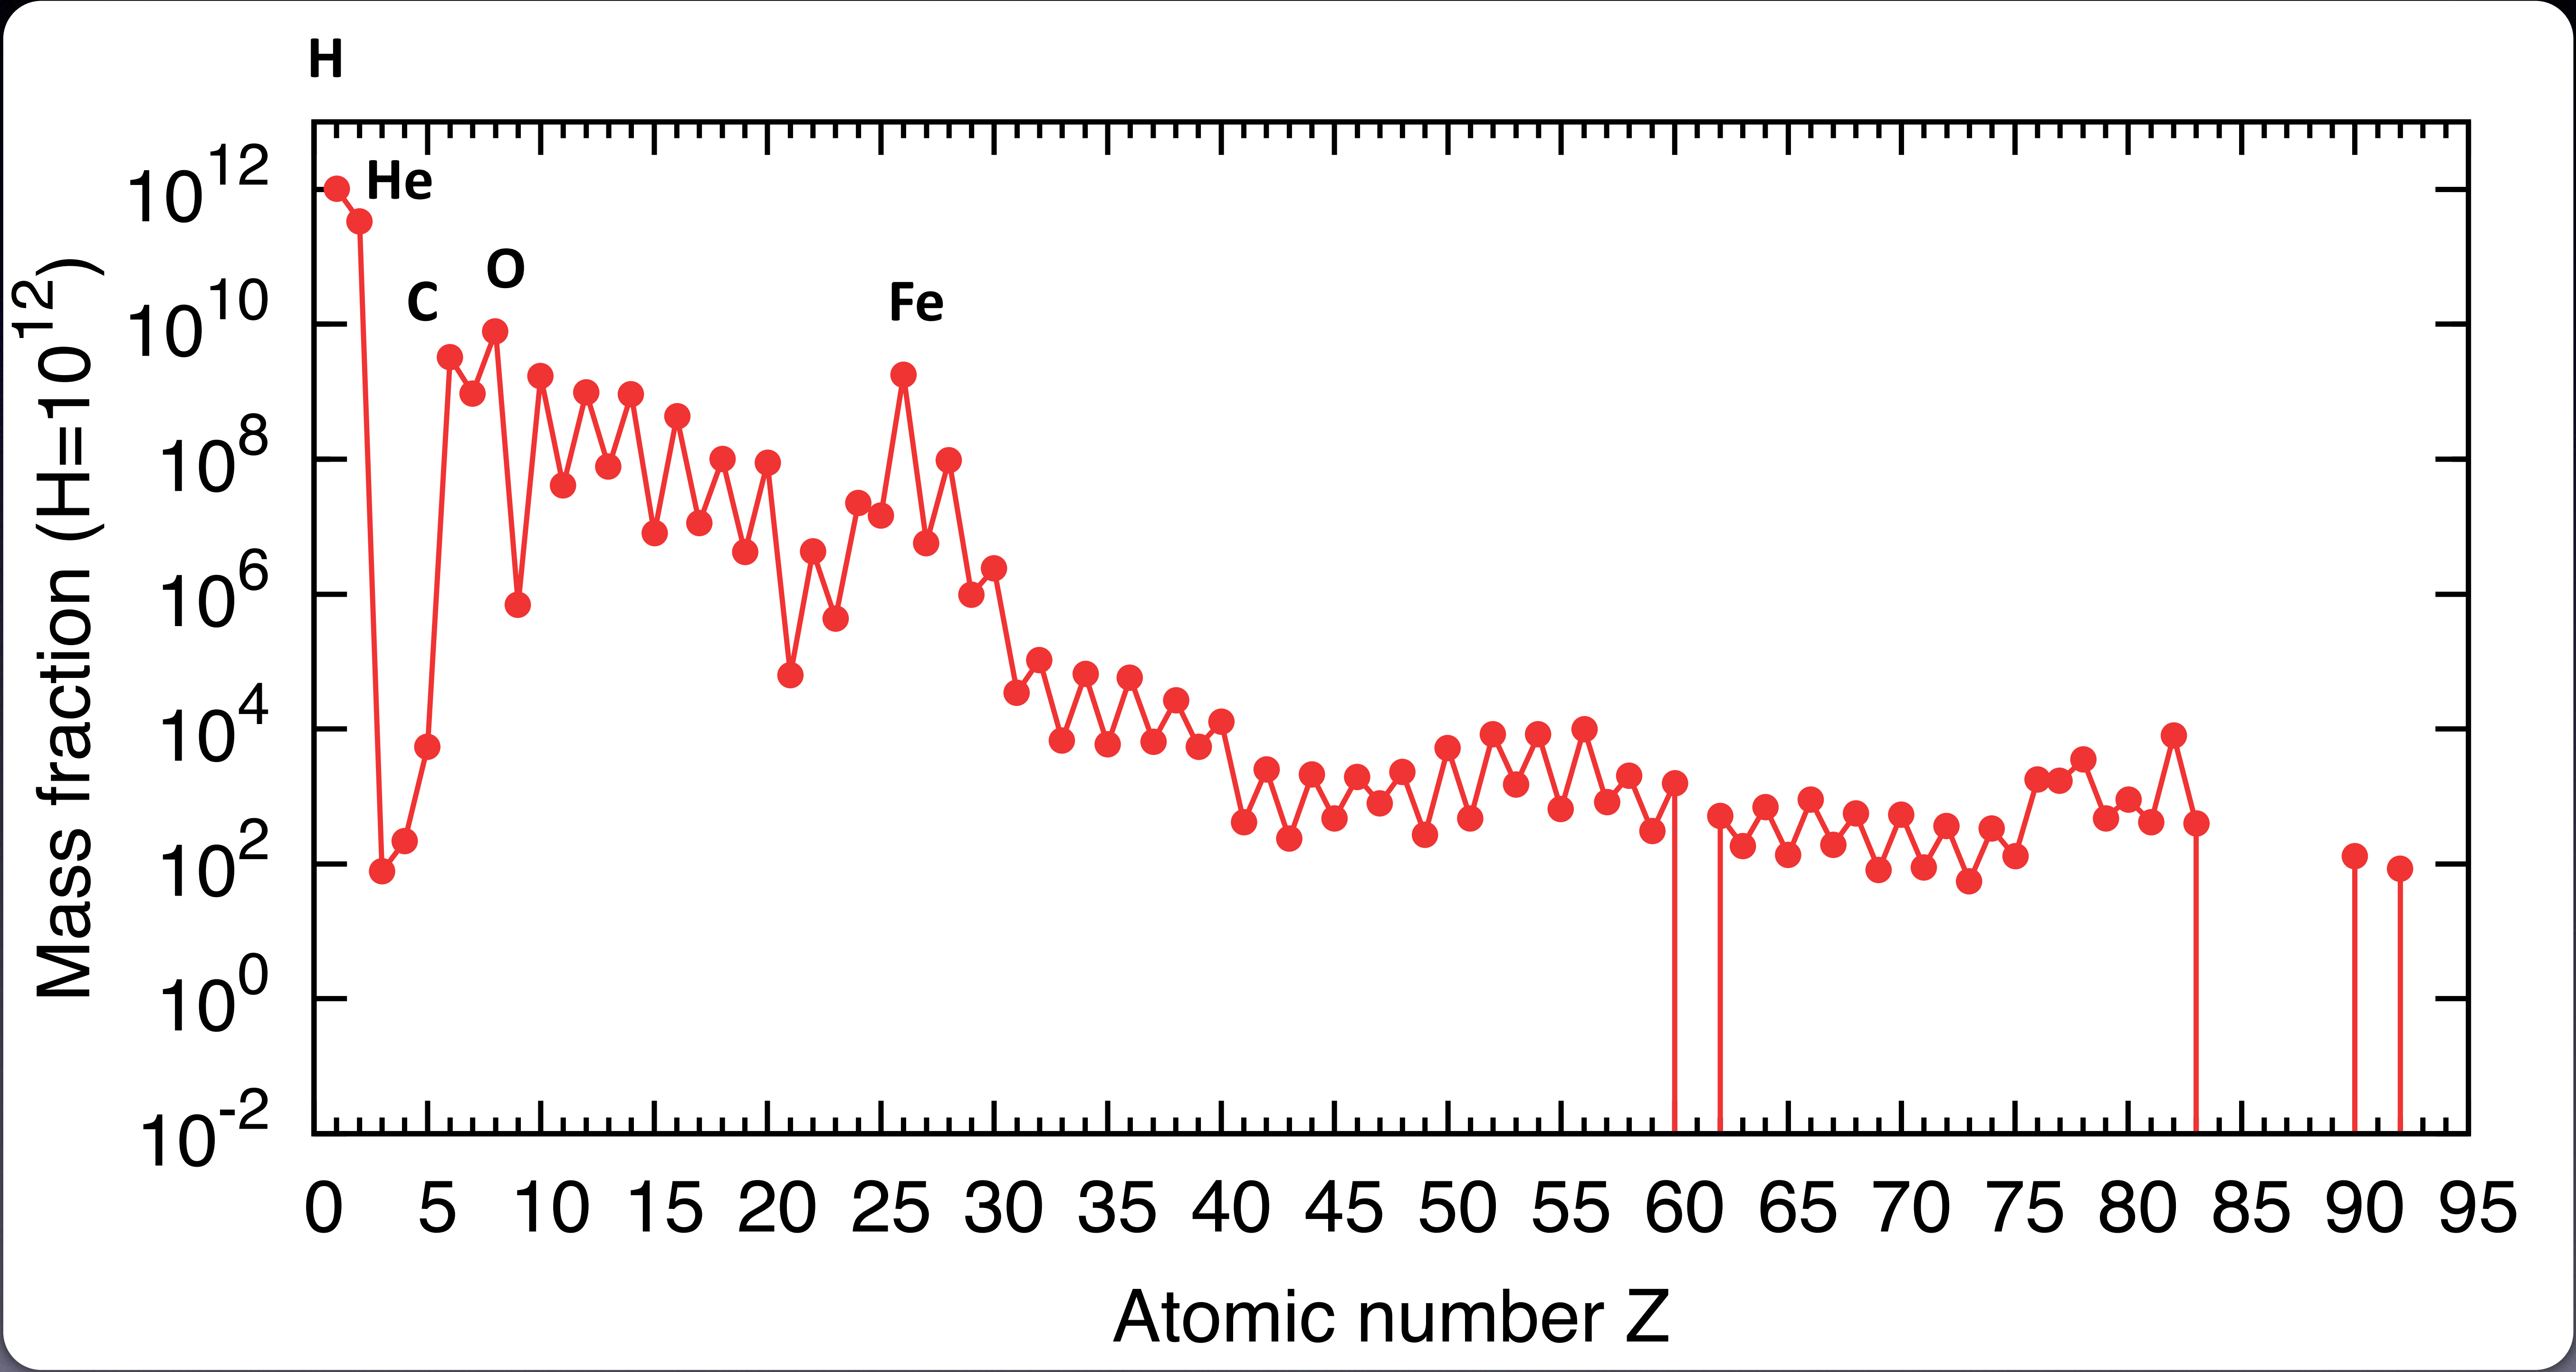
Section 12.
Origin of the elements in the Universe

12.1 Light elements

12.2 Heavy elements

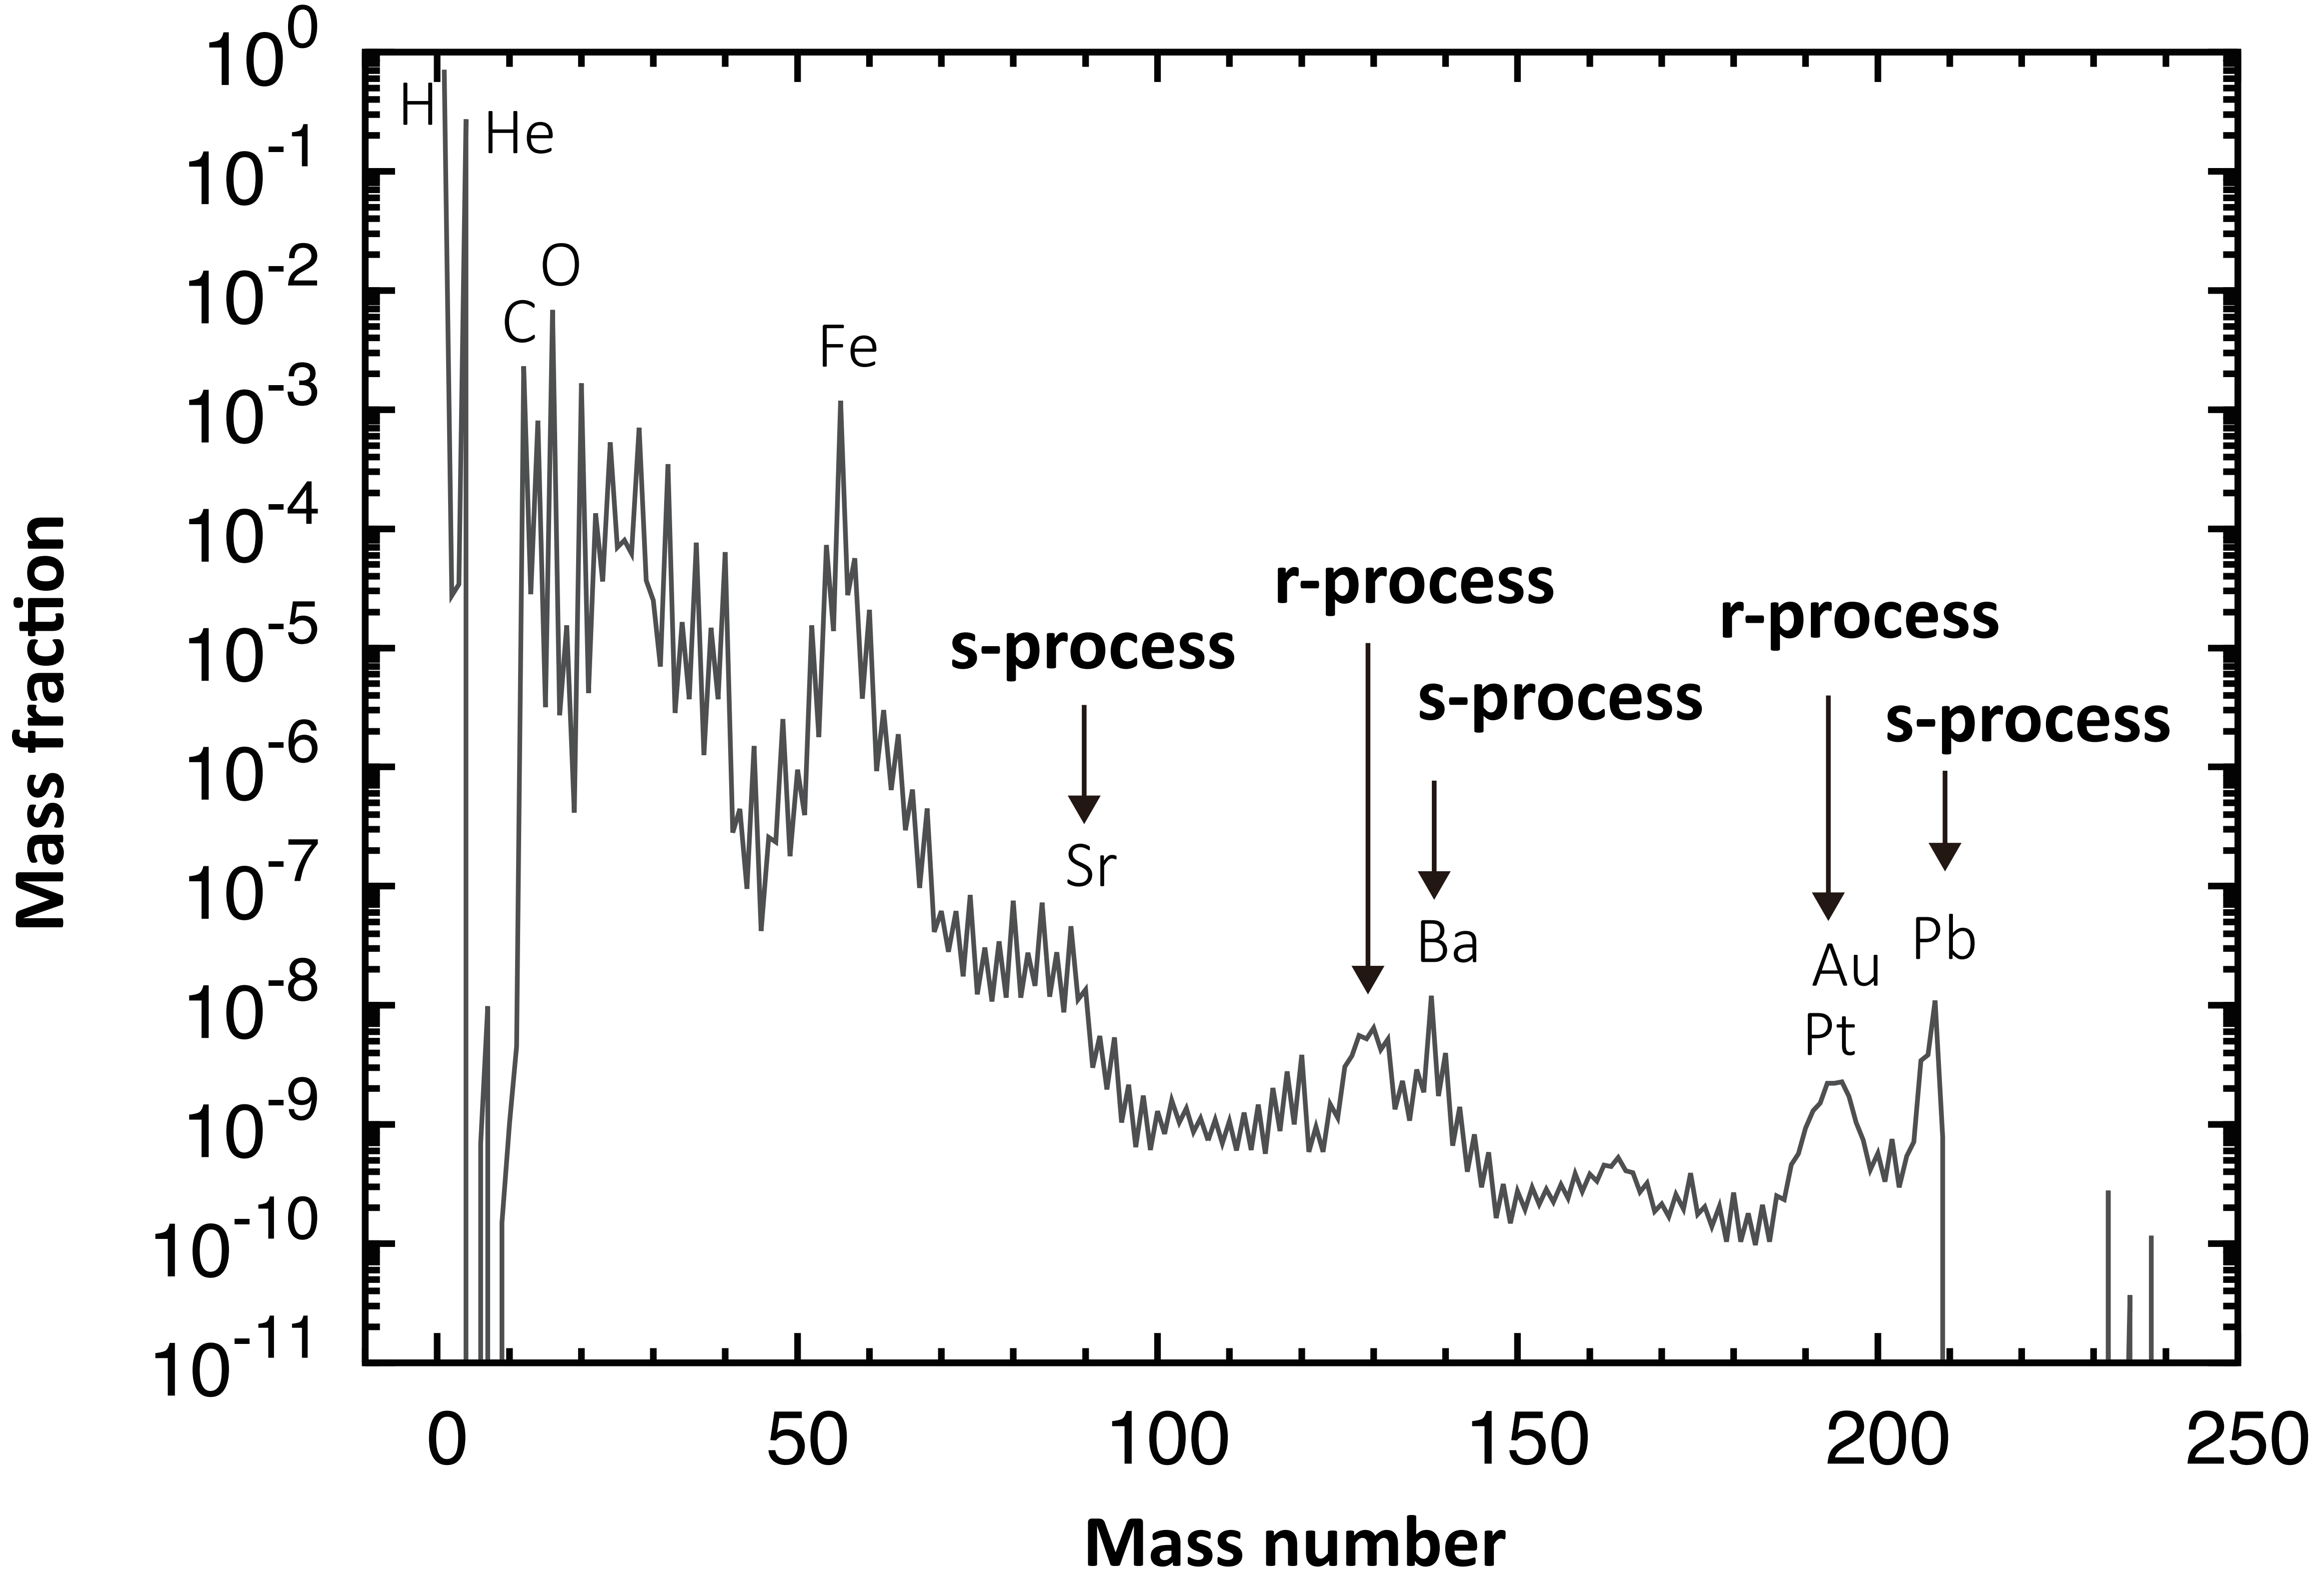
12.3 Chemical evolution of the Universe

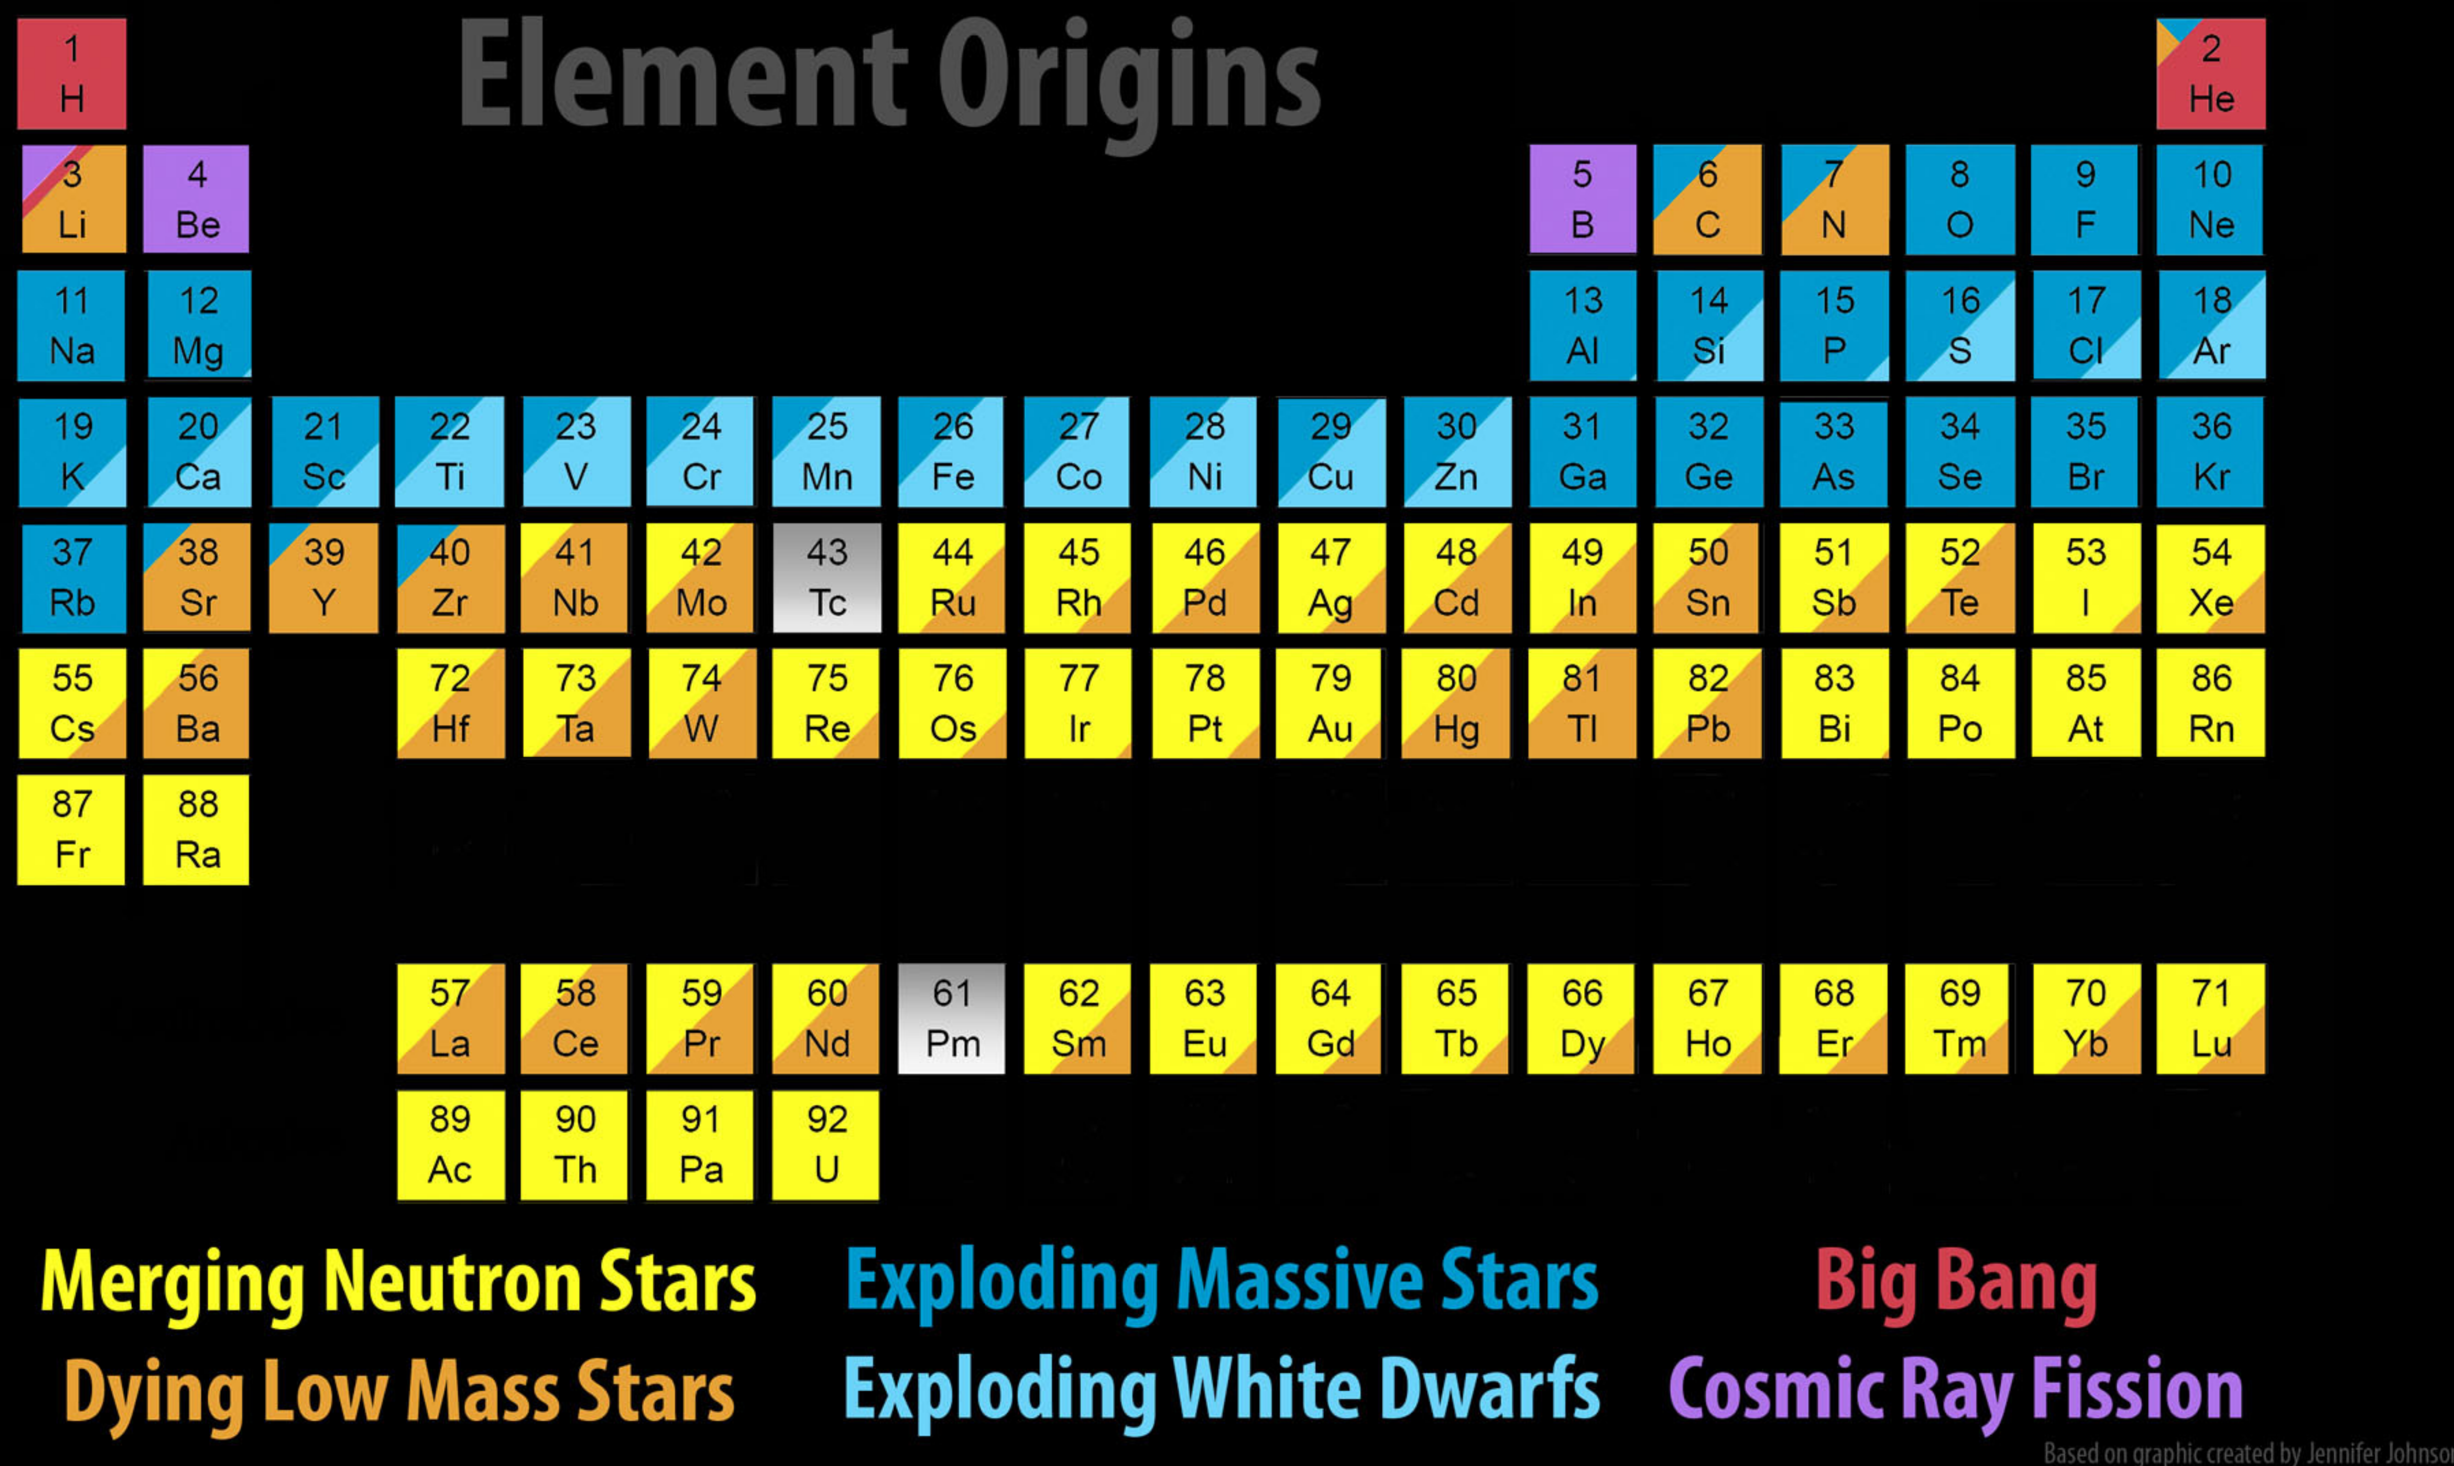
Cosmic abundances (atomic number)



*Mass ratio

Cosmic abundances (mass number)





http://www.caltech.edu/news/caltech-led-teams-strike-cosmic-gold-80074

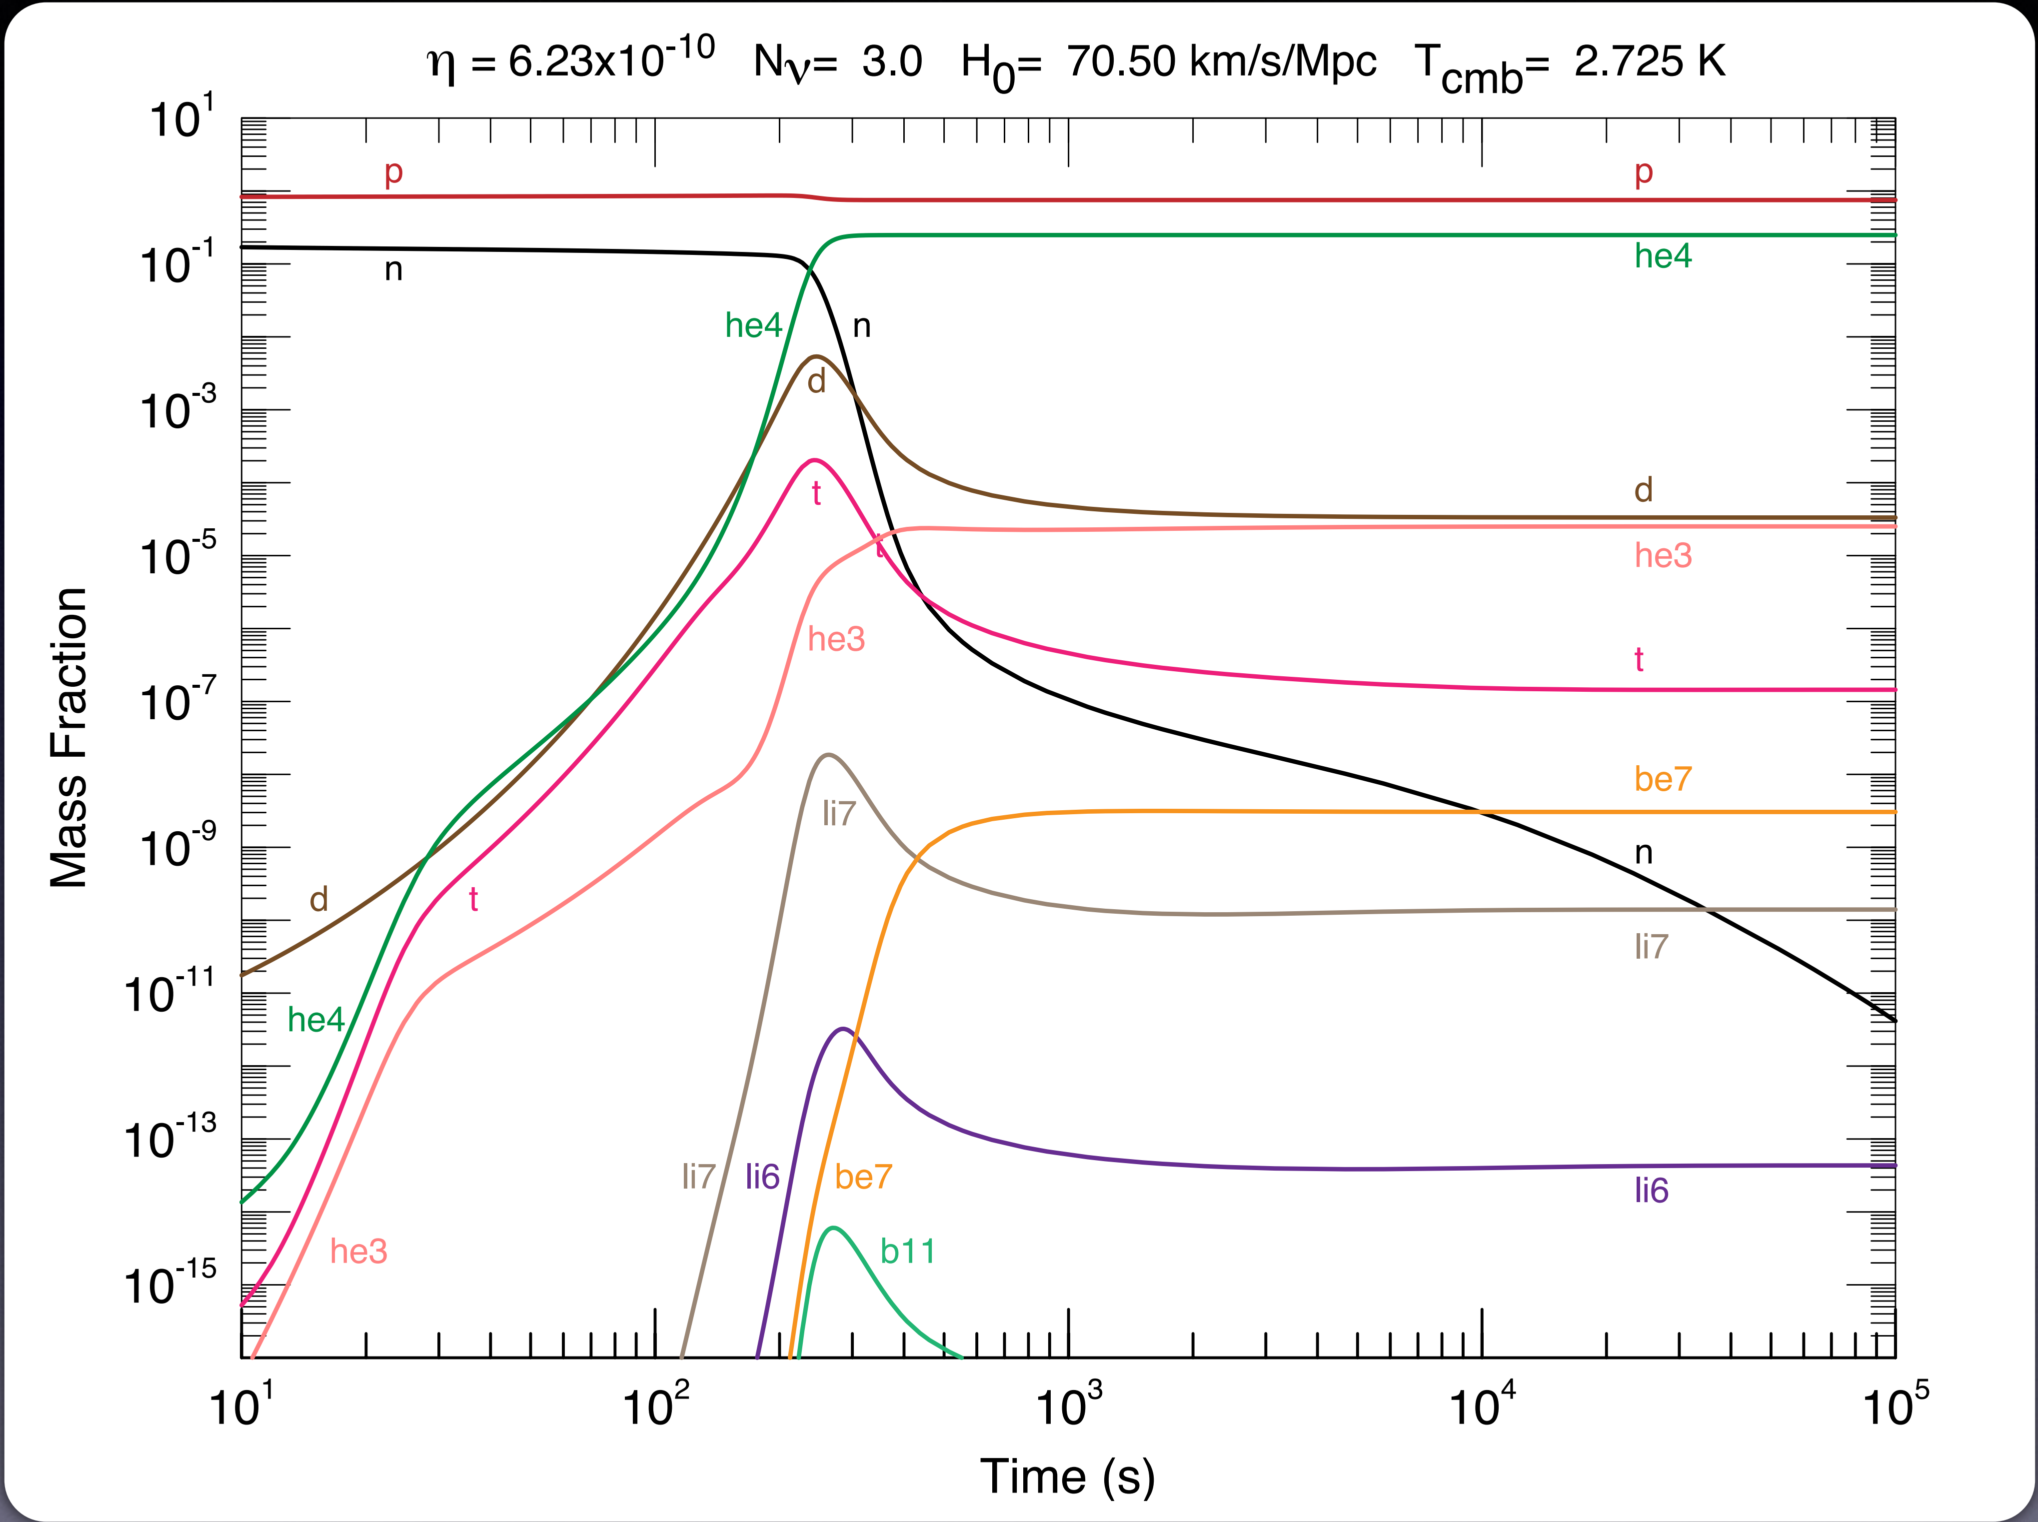
Section 12.
Origin of the elements in the Universe

12.1 Light elements

12.2 Heavy elements

12.3 Chemical evolution of the Universe

Bigbang nucleosynthesis



http://cococubed.asu.edu/code_pages/net_bigbang.shtml

~ 2 sec ~200 sec ~ 300 sec ~ 900 sec Time

n/p ~ 1/6

$$\text{n/p} = \exp(-\Delta m/T)$$

Breakdown of Equilibrium (T ~ 0.7 MeV)

$$\begin{aligned} p + e^- &\leftrightarrow n + \nu_e \\ p + \bar{\nu}_e &\leftrightarrow n + e^+ \\ n &\leftrightarrow p + e^- + \bar{\nu}. \end{aligned}$$

n/p ~ 1/7 (n decay)

Nucleo-synthesis

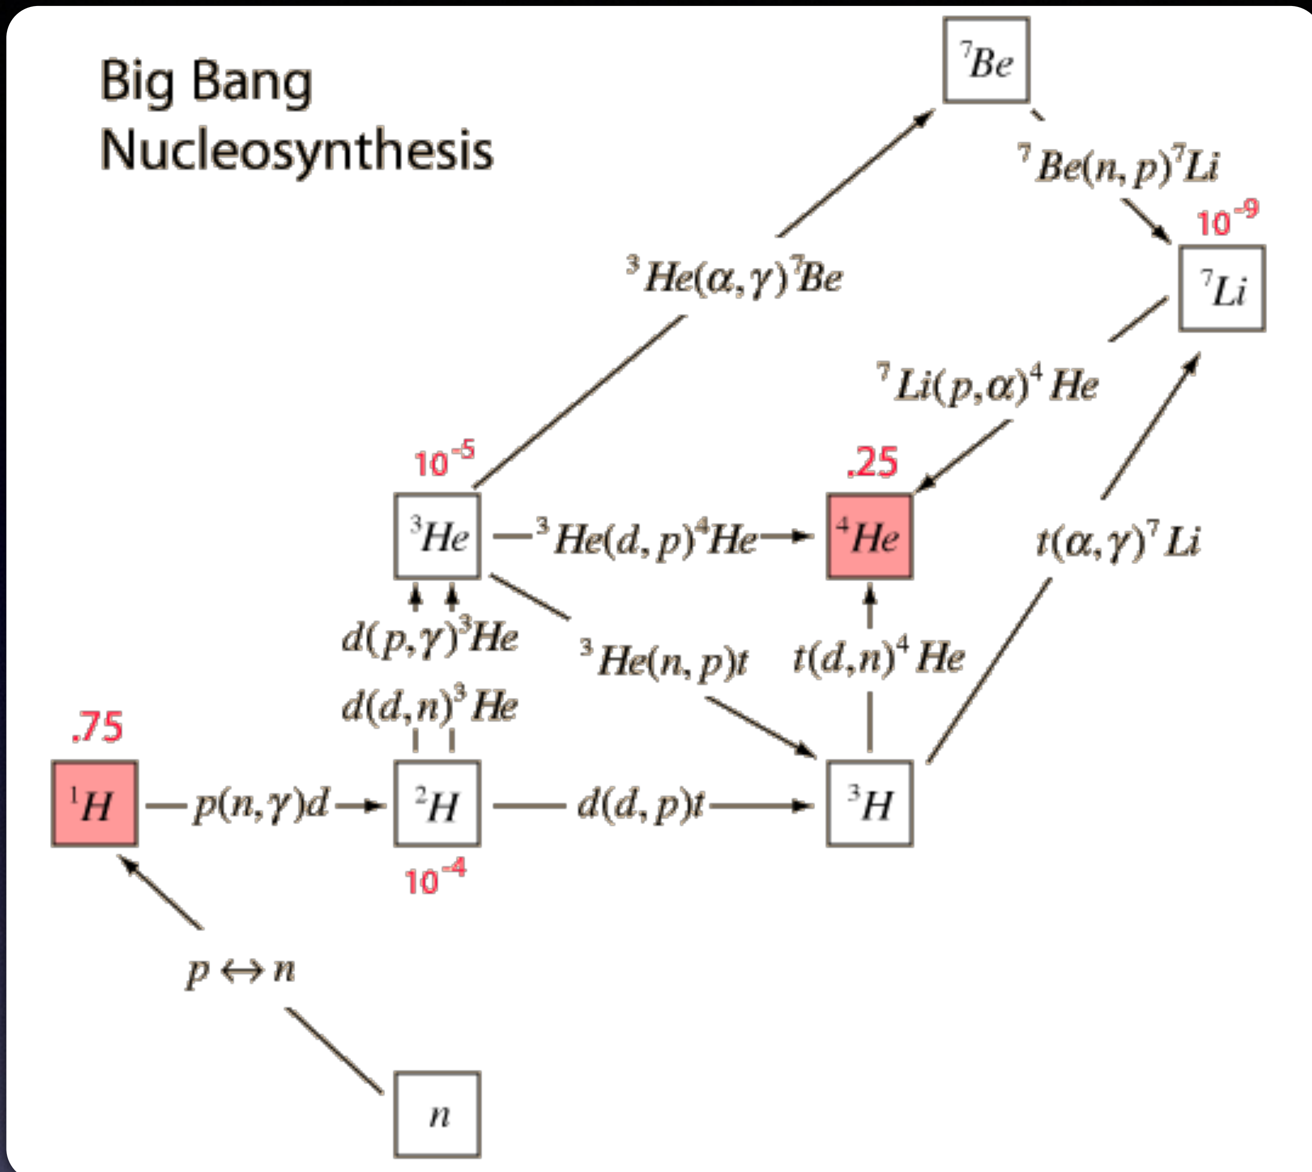
Life time of neutron

The first reaction

$$p + n \longleftrightarrow \mathrm{D} + \gamma$$

- After photon energy decreases (T ~ 0.1 MeV)
- Before neutron decay

* Binding energy of D ~ 2 MeV



http://hyperphysics.phy-astr.gsu.edu/hbase/Astro/bbnuc.html

All neutrons go to 4He (n/p ~ 1/7)

$$Y = \frac{(n_n/2)(2m_p + 2m_n)}{n_p m_p + n_n m_n} \sim 0.25$$

Consistent with Cosmic abundance

No stable nuclei with mass number of 5 and 8

Next reaction will be ^{4}He x 3 inside of stars (Not possible in bigbang due to low density)

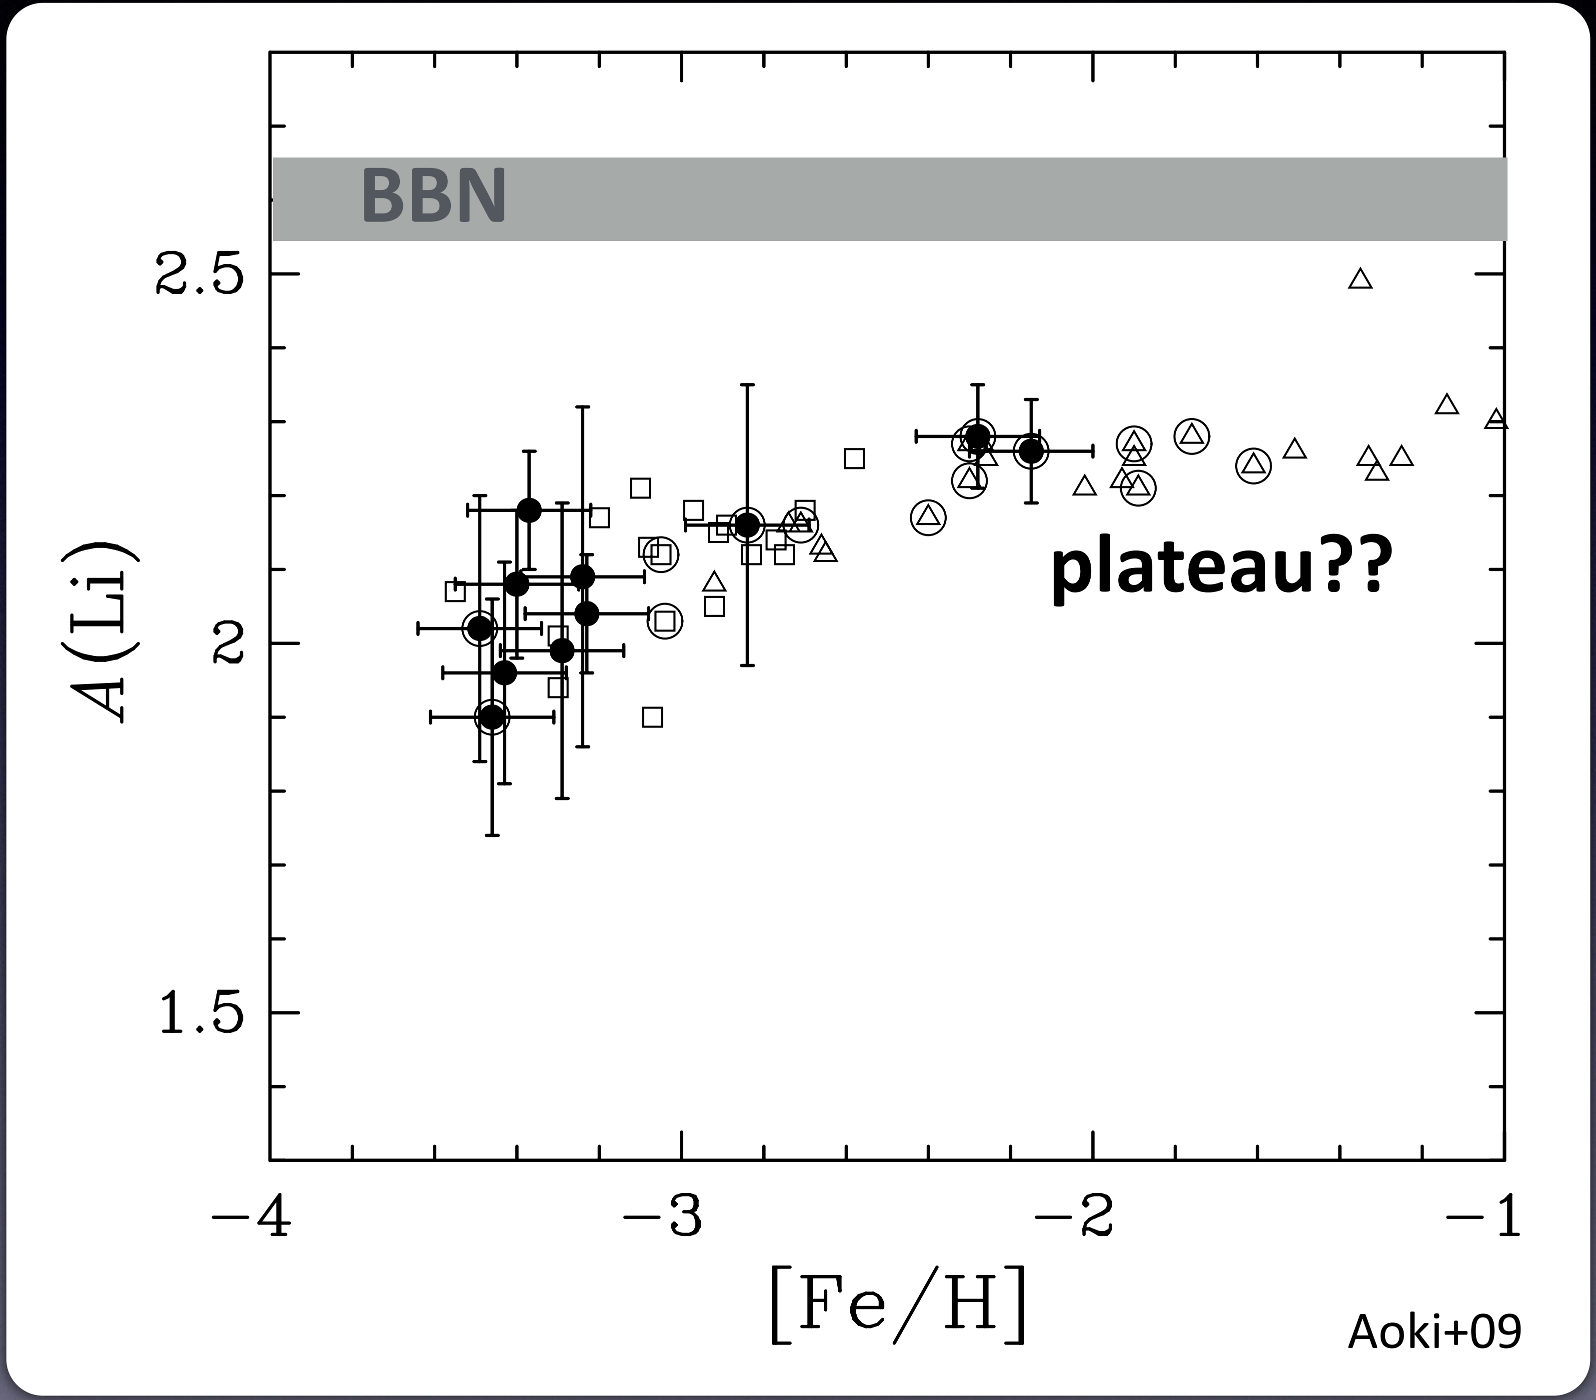
Li problem

$$[A/B] = \log(N_A/N_B) - \log(N_A/N_B)_\odot$$

$$A(\mathrm{Li}) = \log(\mathrm{Li}/\mathrm{H}) + 12$$

Li abundance

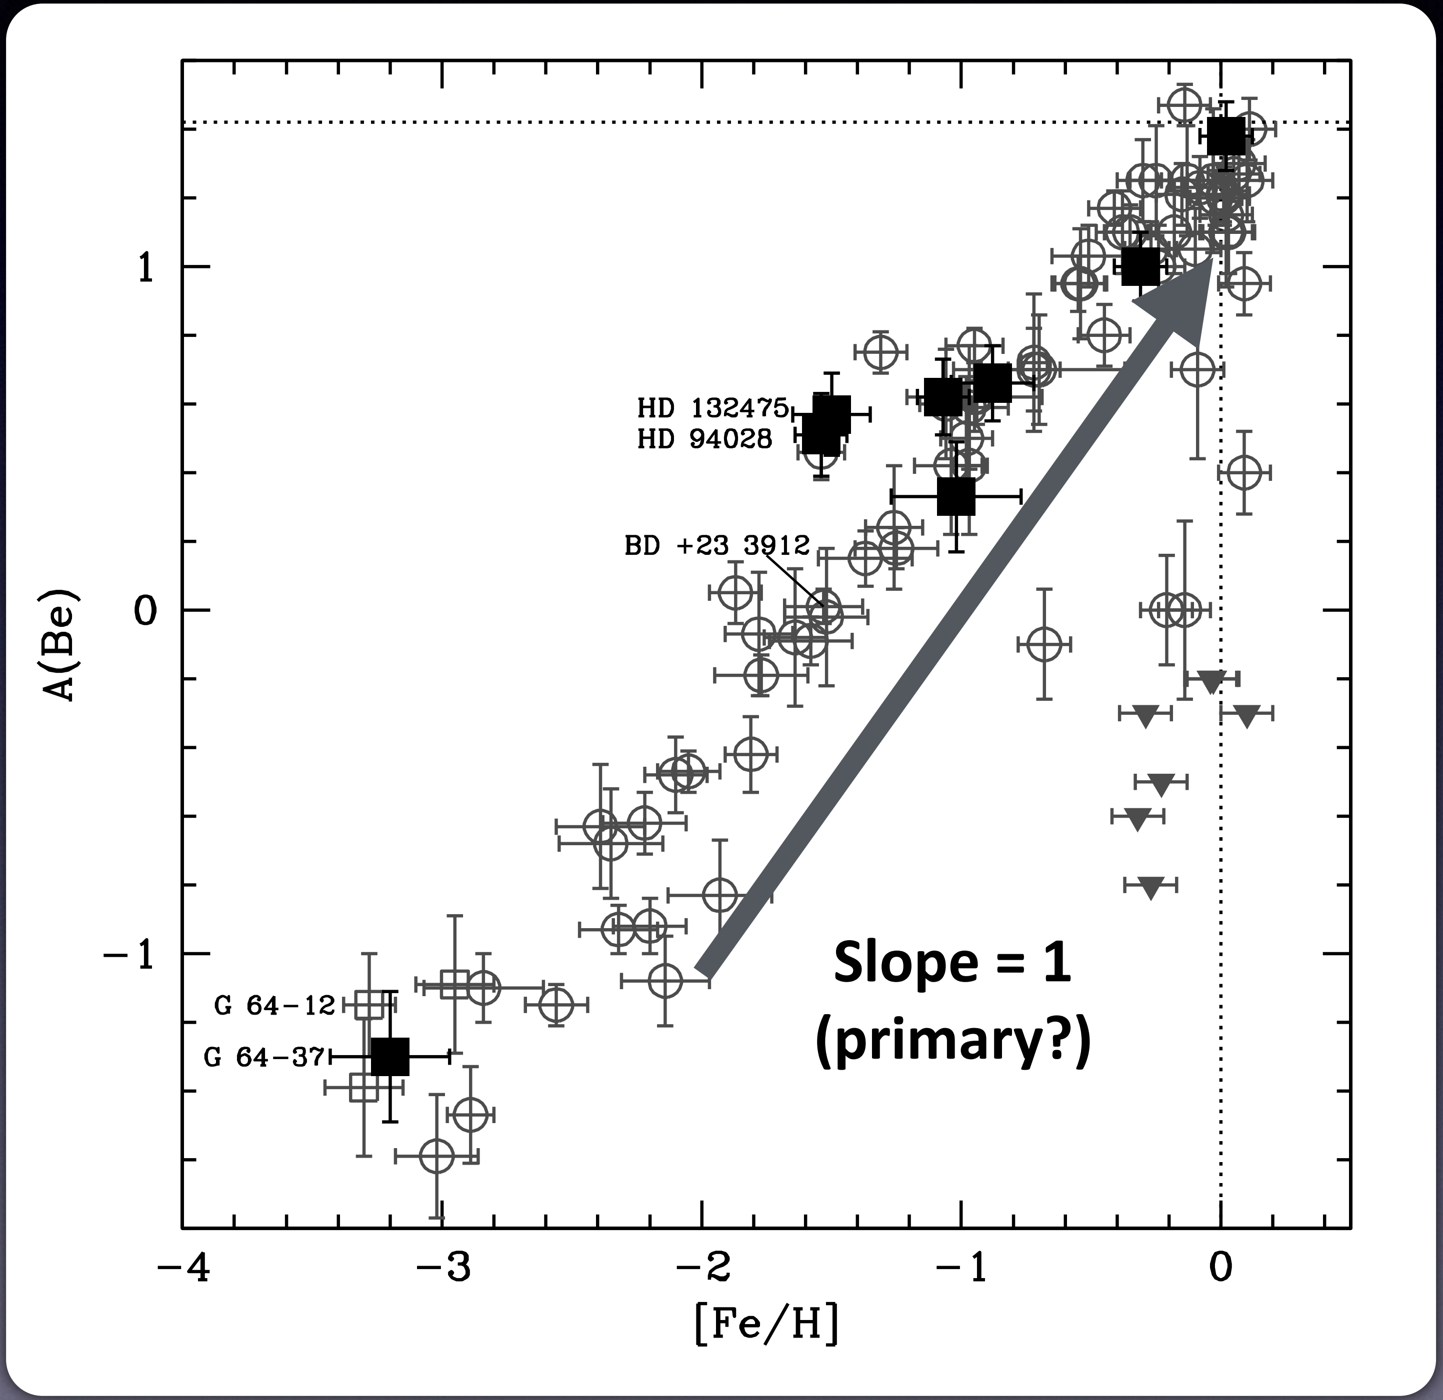
Destruction inside of stars
+
Production by Cosmic ray spallation



Metallicity

Cosmic ray spallation (Li, Be, B)

Cosmic ray(p, alpha)
+ targets (C, N, O)
=> Li, Be, B



Boesgaard+06

Cosmic rays (<= SN)
C, N, O (<= past nucleosynthesis)
=> secondary process (slope = 2)

[Fe/H]

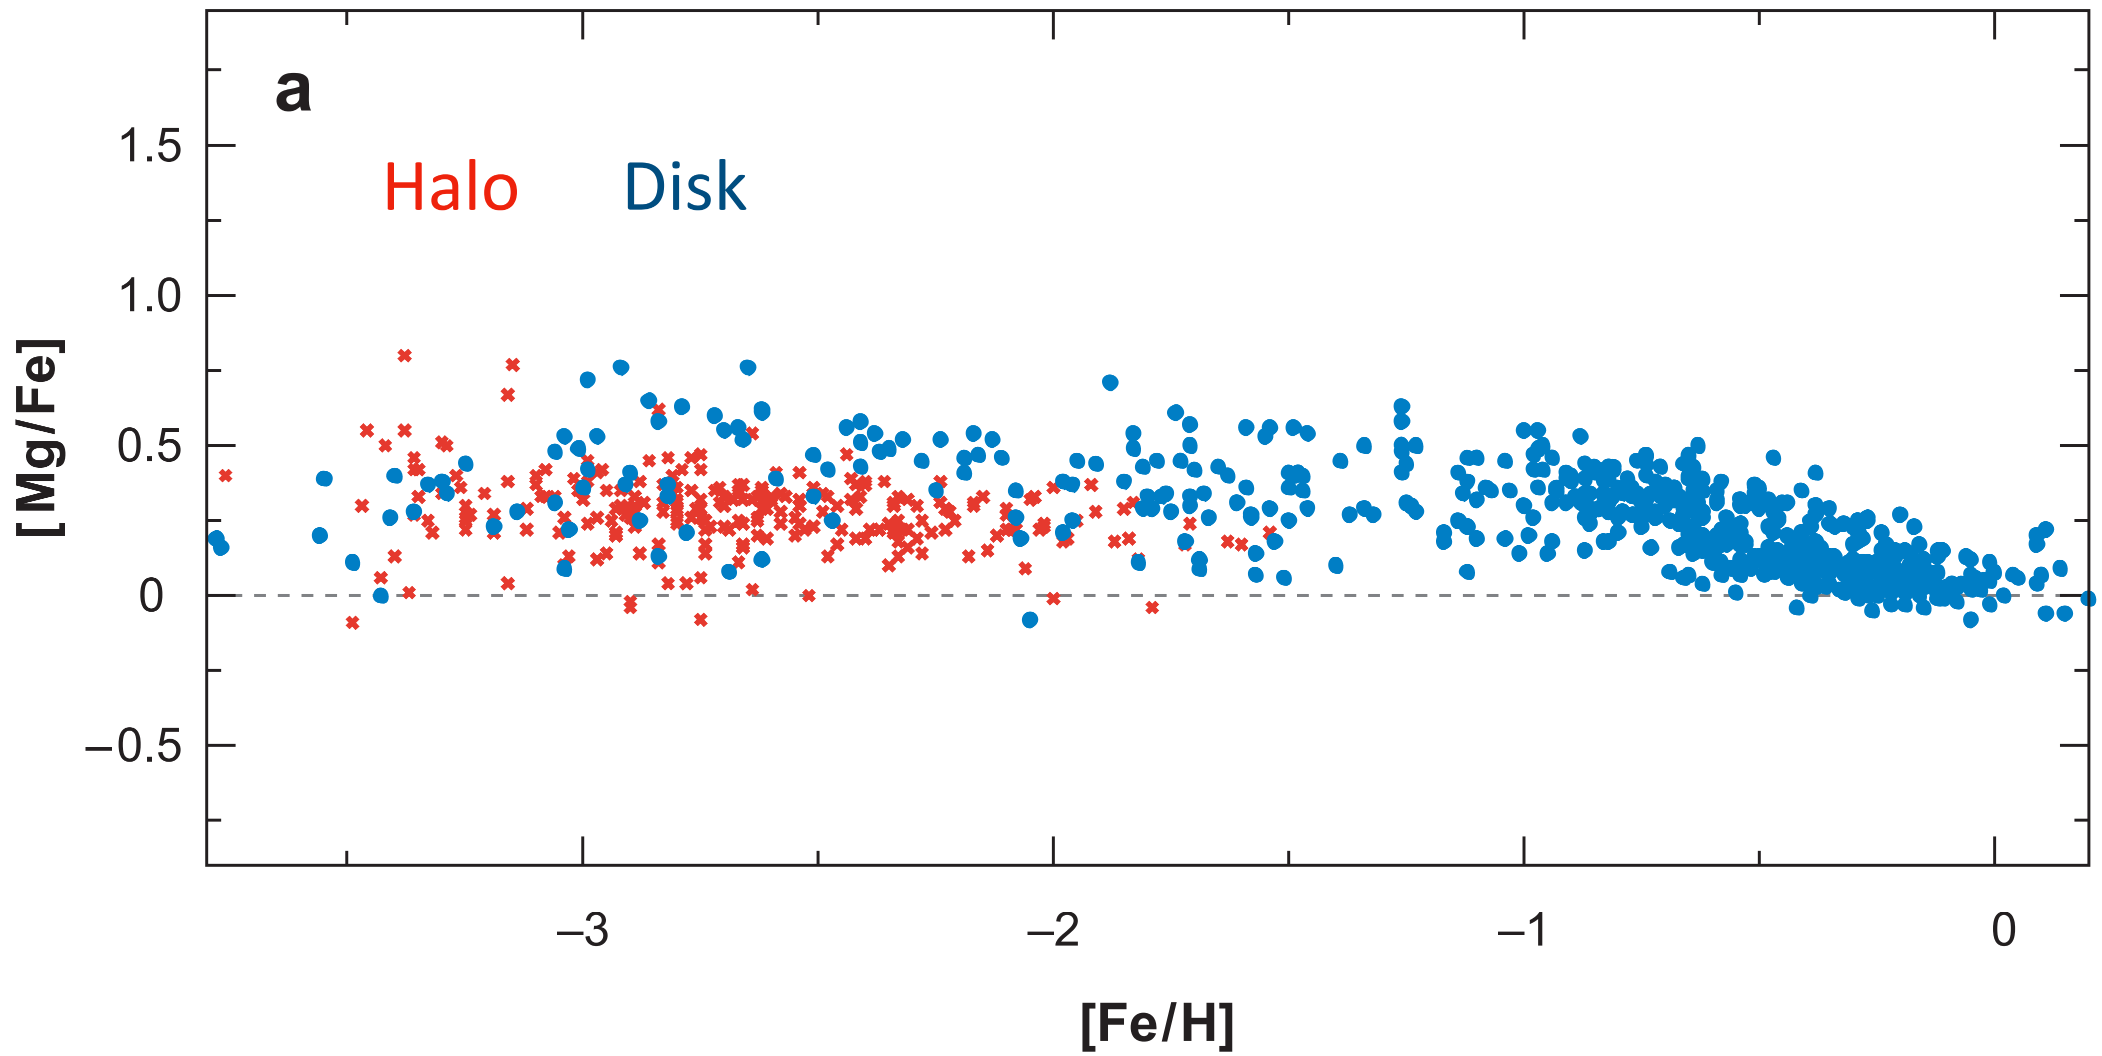
[Mg/Fe]
Core-collapse
SNe
Type Ia
(thermonuclear)
SN
[Fe/H]

Abundance ratio in Galactic stars (Mg/Fe)



Sneden+08

Time

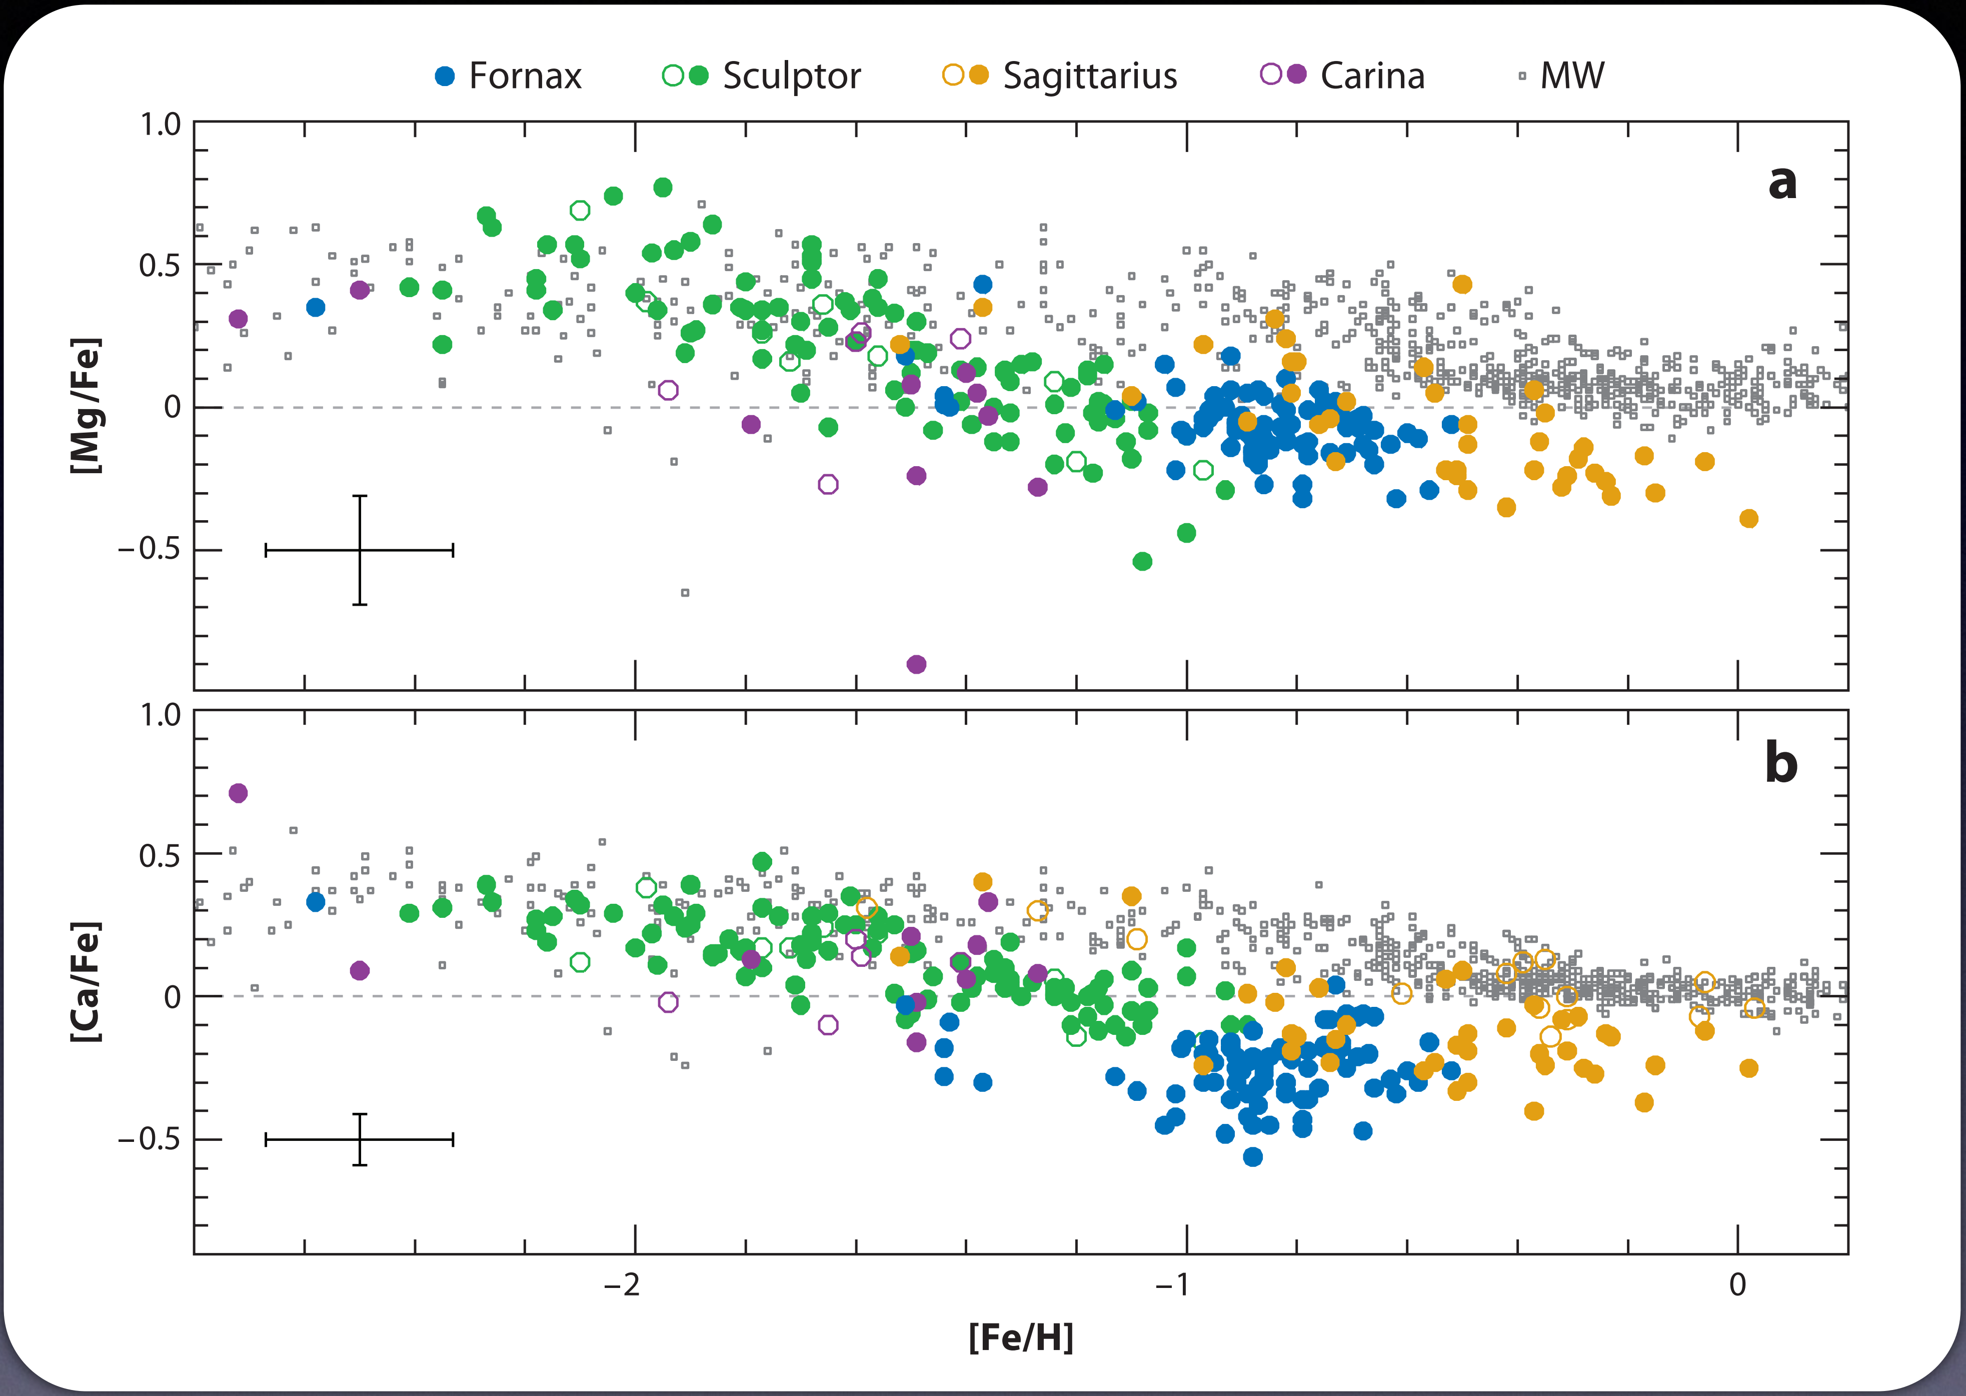
Longer delay time for Type Ia SNe

Our understanding about the nucleosynthesis is correct??

(A) Total amount

(B) Time scale

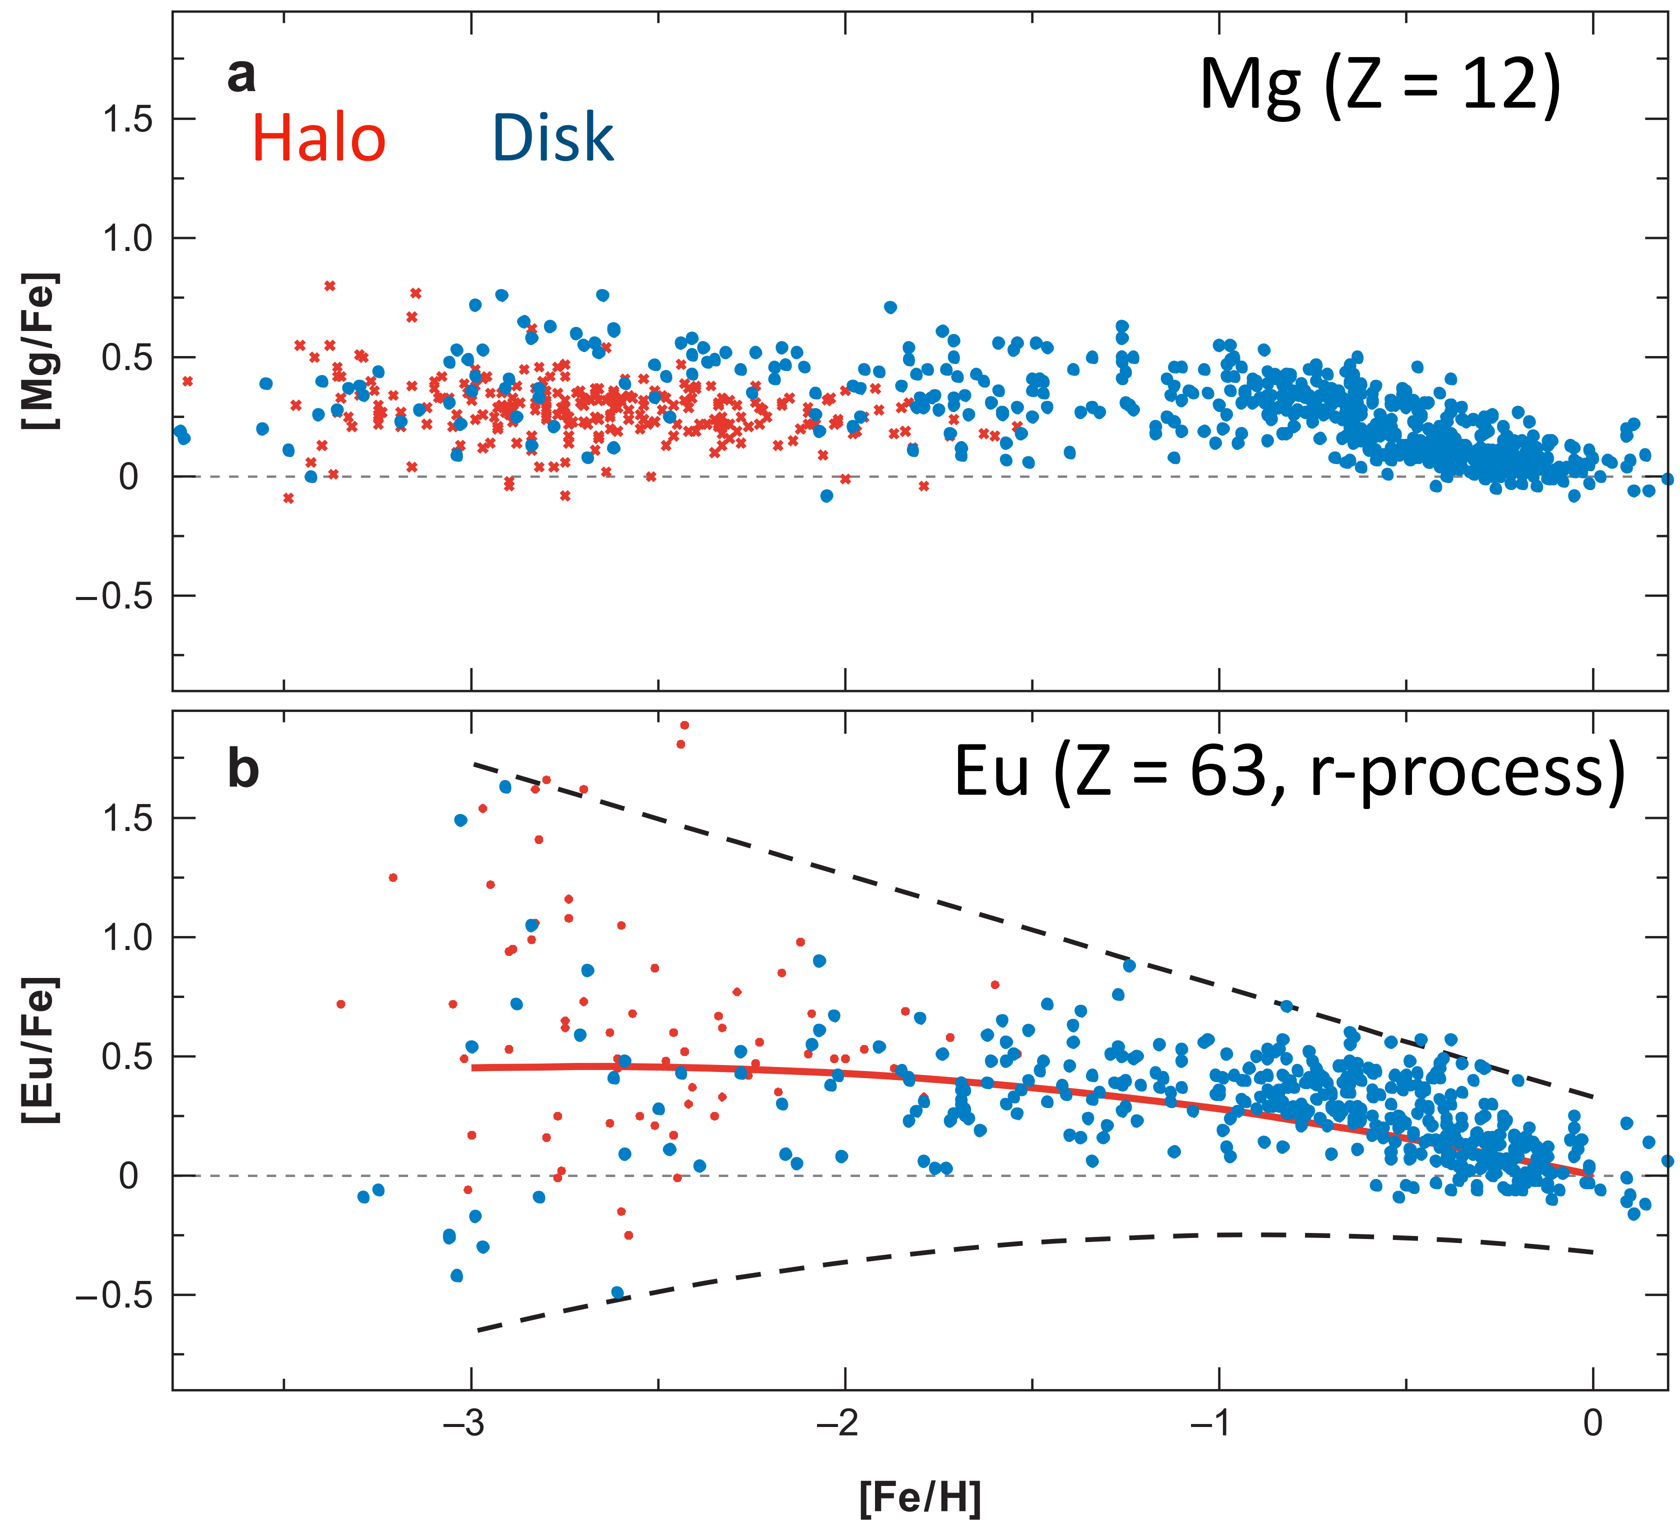
Role as a “clock” in galaxy formation



Tolstoy 08

Fe in dwarf galaxies were smaller when Type Ia SNe begun to operate

Abundance ratio in Galactic stars (r-process/Fe)



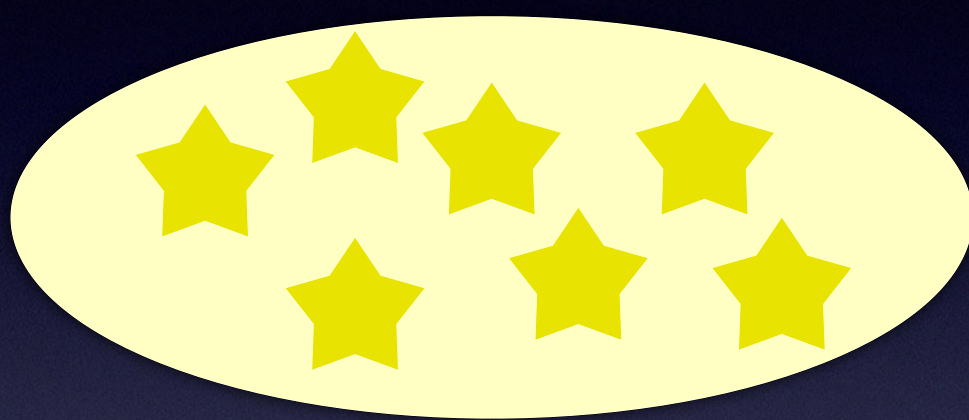
r-process

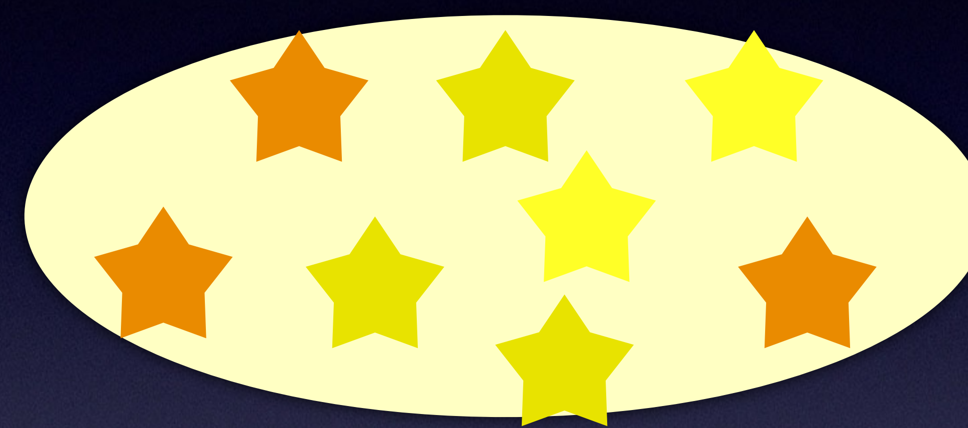
Larger scatter
=> Rare event than
normal core-collapse
supernovae

Sneden+08

High rate
Low ejection

Low rate
High ejection





Smaller scatter in abundance (e.g., Mg)

Larger scatter in abundance (e.g., Eu)

Mixing timescale ~ 100 Myr

Assignment 5

Read one paper focusing on chemical elements or metallicity in your research area and summarize the contents in 2 pages.

(ex.) Measure the metal abundances of galaxy to know XXX.

Phenomena XXX is affected by metallicity because YYY.

An instrument using the property XXX of the element YYY.

In the report, please include following points:

(1) Why you choose that paper

(2) Central problem of the field

(3) Method and uniqueness

(4) Results

(5) Implications

レポート課題 5

自分が研究している(興味のある)現象・対象で
「元素」や「金属量」に着目している論文を探し、
その内容をA4 2ページ程度にまとめよ。

(例) 銀河の元素量を測って、… を知る
金属量が異なると、…の効果で… はこのように影響を受ける
この装置は…という元素の … という性質を使っている

レポートには以下の点を含めること。

(1) なぜその論文を選んだか

(2) 当該研究分野の中心的問題

(3) 手法とユニークさ

(4) 結果

(5) 結果から導かれたこと

Summary: Origin of the elements in the Universe

- **Origin of the elements**
  - Bigbang nucleosynthesis: H, He, Li
  - Cosmic-ray spallation: Li, Be, B
  - Stellar interior: C-Fe
    (AGB stars, core-collapse SNe, thermonuclear SNe)
  - Neutron capture: > Fe
    s-process: AGB stars
    r-process: SN? NS merger?
- **Test with stars in our Galaxy and dwarf galaxies**
  - Close relation with galaxy formation
